How can I save the contents of a webpage on substack, like https://newsletter.pragmaticengineer.com/p/steve-yegge-on-ai-agents-and-the into a markdown or other format you can read and summarize?

You have a few good options, depending on whether you want a one-off export (fast) or a repeatable pipeline (best), and whether the post is paywalled.

Option 1: Use a "Substack → Markdown" tool

If you want Markdown that I can reliably summarize, the most direct approach is a converter that downloads the post and writes a `.md` file. One commonly used CLI tool is **Substack2Markdown**, which downloads Substack posts and saves them as Markdown (and HTML), including premium posts if you have access (i.e., you're subscribed/logged in with credentials the tool can use).[1]

There are also browser-based "Substack Reader / export" style tools, but they typically only work for free (non-paywalled) posts; paid exports usually require a local tool with your authenticated access.[2]

Option 2: "Print to PDF" (most universal)

If the goal is "save what I'm allowed to read" with minimal fuss, open the post in your browser (logged in if needed) and use **Print** → **Save as PDF**. People commonly do this for paid Substacks when there's no official download button.[3]

Then you can either:

- Upload the PDF here (if your interface supports file upload), or
- Convert PDF → text/Markdown locally (see Option 4).

Option 3: Browser extension "Webpage to Markdown"

A general "save webpage as Markdown" Chrome extension can work well for public Substack pages (and sometimes for logged-in views, depending on how the page renders). For example, "Save — Web to Markdown" advertises one-click conversion of webpages into Markdown.[4]

This is convenient for single articles, but the output quality can vary (especially around embeds, captions, footnotes, and paywall preview cutoffs).[4]

Option 4: DIY, robust (curl/HTML → Markdown)

If you want a repeatable, inspectable workflow:

1. Save the page as HTML (browser “Save Page As…”, or use a tool that captures the rendered HTML).
2. Convert HTML → Markdown with a converter like Pandoc:
    - `pandoc -f html -t gfm input.html -o output.md`

This tends to produce cleaner Markdown than “copy/paste,” and it works well when you already have the full HTML (including from authenticated sessions). (Pandoc isn’t in the sources above, but it’s the standard approach in this category.)

What I need from you

Tell me which path you prefer (tool / PDF / extension / DIY), and whether the post is free or paywalled for you.

If you want the simplest handoff to me: export to **Markdown** (Option 1 or 3) or **PDF** (Option 2), then paste the Markdown here or upload the file, and I’ll summarize it.[1] [3]
