A System That Compounds

You don't need a smarter AI. You need a system that accumulates.

DYMON ASIA · SESSION 2

Superlinear Academy

Last time, in 60 minutes

Task	Chatbox	Agent
Organize messy files	Tells you how; you do it	Does it, in your folder
Chart from data files	You paste the data in	Reads the files itself
Something breaks	You paste the error back	Sees it, fixes it, reruns
Your preferences	Forgotten next chat	Saved to a file, always applied

And one sentence to keep: your words became assets, not chat logs.

From one seed to the whole system

Today you tour the system we've run for a year — then you take it home.

EXPERIMENT

one prompt, two runs

→

WHY

Context is Alpha

TAKE HOME

copy the homework

One prompt, two runs

Pull the latest sell-side and bank research on Micron (MU) via MCP.

Write me a brief on where DRAM/HBM expectations stand.

RUN A — bare agent

RUN B — inside the system (live)

Same model · same tools · same prompt

Same facts. Look at the shape.

Roughly the same facts in both. A completely different shape.

Prompt, data, and both outputs ship in your handout.

Why: three facts about LLMs

1 **Stateless: a powerful CPU that reboots every session**

What's on your disk decides its output

2 **Its default output is consensus**

Consensus is Beta. Your differentiated view is Alpha

3 **The bottleneck moved from the model to your context**

Model upgrades are shared. Your context is only yours

Context is Alpha

Context is Alpha. So where do you start?

Building context from zero is slow — and you'd be guessing at the structure.

THE GOOD NEWS

You can copy the homework.

The system we've run for a year has a public reference implementation — today we tour it.

The big picture: three tiers

TIER 1

Bare model

Consensus. No alpha.

TIER 2

The frame + baseline axioms

Frame solves the mechanics of compounding. Axioms give an informed-practitioner floor.

TIER 3

Your variant perception

Only you can fill this.
The move: edit a file.

Everything you see today lives somewhere on this ladder.

The thing you copy

A public reference implementation. Plain markdown — works in Codex, Claude Code, Cursor.

`rules/`

identity & standards

`rules/skills/`

capabilities & practices

`rules/axioms/`

the judgment layer

github.com/grapeot/context-infrastructure-en

What the AI reads when it wakes up

Live: we walk the startup sequence, file by file.

- `AGENTS.md — start here`
- `rules/SOUL.md`
- `rules/USER.md`
- `rules/WORKSPACE.md`
- `rules/skills/INDEX.md`

The booting sequence

Every file answers one question

`SOUL.md`	Who is the AI?
`USER.md`	Who are you? HIGHEST ROI
`WORKSPACE.md`	Where does everything live?
`skills/INDEX.md`	What can it do, loaded on demand?

A skill is the unit of reuse

One markdown file the AI reads before doing one kind of task.

```
Install the Outlook skill from this repo and use it for my mail.
```

installing is one sentence

grapeot.github.io/skills

A public registry — browse, pick, one-click install prompts.

At work, install Dymon-approved internal versions — the public ones are for demo.
An internal registry like this is worth building.

Capability skills: the way in, the way out

Browse only today — each is one file plus a small tool, installed in one sentence.

INTAKE

`outlook_skill`

Mail and calendar become files the AI can read

the task arrives by itself

OUTPUT

`pptx.skill`

It writes the PowerPoint deck for you

the result leaves in your format

Practice skills: they change how it thinks

`workflow_internal_writing`

briefs your PM can skim and audit

`workflow_external_writing`

prose that doesn’t read machine-made

`workflow_deep_research_survey`

multi-source surveys with an audit trail

How to dissect a task and write your own — Session 3.

When skills multiply

Dozens of skills can't all ride along in every session — context bloats, and every rule dilutes the rest.

A new hire doesn't memorize the handbook — they get a map.

The judgment layer, browsable

Built for Dymon: a PM-role baseline, about 30 axioms.
Informed-practitioner level. Overwrite it desk by desk.

r01	**Source hierarchy: who to trust, in what order**
j01	**Consensus vs variant: keep them separate**
ai06	**The public-data ceiling: know where it ends**

PM-ROLE BASELINE

Find it in your handout

GENERAL AXIOM LIBRARY — PUBLIC

GROW YOUR OWN

The experience behind the axioms

No shortcut — it comes from your work

Open the folder in Obsidian: this is your LLM wiki, plain markdown underneath.

TASK IN · PULL · COMPARE · BRIEF · AXIOM EDIT · BACKFLOW

The full loop, live

- A PM email in, a one-page brief out — no window switching
- Every part you just toured, working together

```
Inbox: 'Where do MU / HBM expectations stand vs our last take? One page.'
```

AI lays out the evidence. You make the call.

CROSS-SOURCE DISAGREEMENT

Who is aggressive, where they split, what each cites — with links

DELTA VS YOUR OWN NOTE

Where new material contradicts what notes/mu.md recorded last time

The verdict is never the AI's job.

The delta brief

- **Bottom line first**
- **The delta, not a recap**
- **Every claim carries its source**
- **Work orders and kill signals — the verdict stays with the PM**

MU Weekly Delta Brief — Week of Jun 28 – Jul 4, 2026 (vs. prior week)

Prepared: 2026-07-09, from public data only · **Inputs:** `facts/facts_week_2026-06-21.md`, `facts/facts_week_2026-06-28.md` **Axioms loaded:** R01 (source hierarchy), R02 (sell-side usage), R03 (earnings-as-thesis-test), R07 (decision surface), J01 (consensus vs. variant), J02 (catalyst timing), J06 (expectation-changing variables), M01 (price as information), AI06 (public-data ceiling). **Boundary:** this brief lays out evidence and candidate framings. It makes no investment recommendation; every verdict below is explicitly left to the PM. Demo artifact — not investment advice.

Bottom line

The market has stopped paying Micron for good news. In the week of interest the stock fell **13.3%** to 976 — **below where it traded before the largest earnings beat in its history** — while sell-side raised targets to a mean of ~$1,486 (+52% above spot) and the company announced two new strategic customer agreements. A beat of this size followed by a full round-trip is the highest-information tape pattern a quarter can produce (R03): it tells you the marginal buyer at these levels was already fully invested in the bull case, and the debate has moved from "is the business good" to **"is FQ4's $50B / 86% GM the peak."** The disagreement worth your attention is no longer between bulls and bears on fundamentals — it is between a unanimous, still-raising sell-side and a tape that has refused to confirm it since the print (M01).

What changed vs. last week (the delta)

Dimension	Prior week (6/21–27)	Week of interest (6/28–7/4)	Read
Price	Whipsaw around print; closed ~flat (1125)	–13.3% to 976; below pre-print close 1048; –22% off the 1255 record	Distribution, not consolidation
Fundamentals news	FQ3: rev $41.46B (+346% YoY), EPS $25.11, FQ4 guide $50B (~$6.5B above street)	No new financials; GM agreement (7/1), Trump Accounts (6/30)	Fundamental flow still positive
Sell-side	~15 PT raises on 6/25; three firms at $2,000	Cantor to $2,000 (6/29); zero downgrades; mean PT ~1486	Consensus fully committed, still moving up
Sector tape	KOSPI –10% shock (6/23), reversed by MU's print (6/25)	Samsung beat-and-drop (–7% on a 19× profit quarter)	Expectations exhaustion is sector-wide, not MU-specific
Narrative	"Regime change" (SCAs, memory tax, CHIPS unlock)	"Momentum factor is a crowded consensus trade" (22V)	The marginal narrative flipped from earnings to positioning

The central fact of the week: **consensus expectations and price moved in opposite directions.** Per M01, price contradicting a rising-estimate narrative is information about what you don't hold in your model — most plausibly positioning saturation, not a fundamental data point, since nothing negative and company-specific printed during the window.

Disagree with our baseline? Good.

Say it out loud

↓

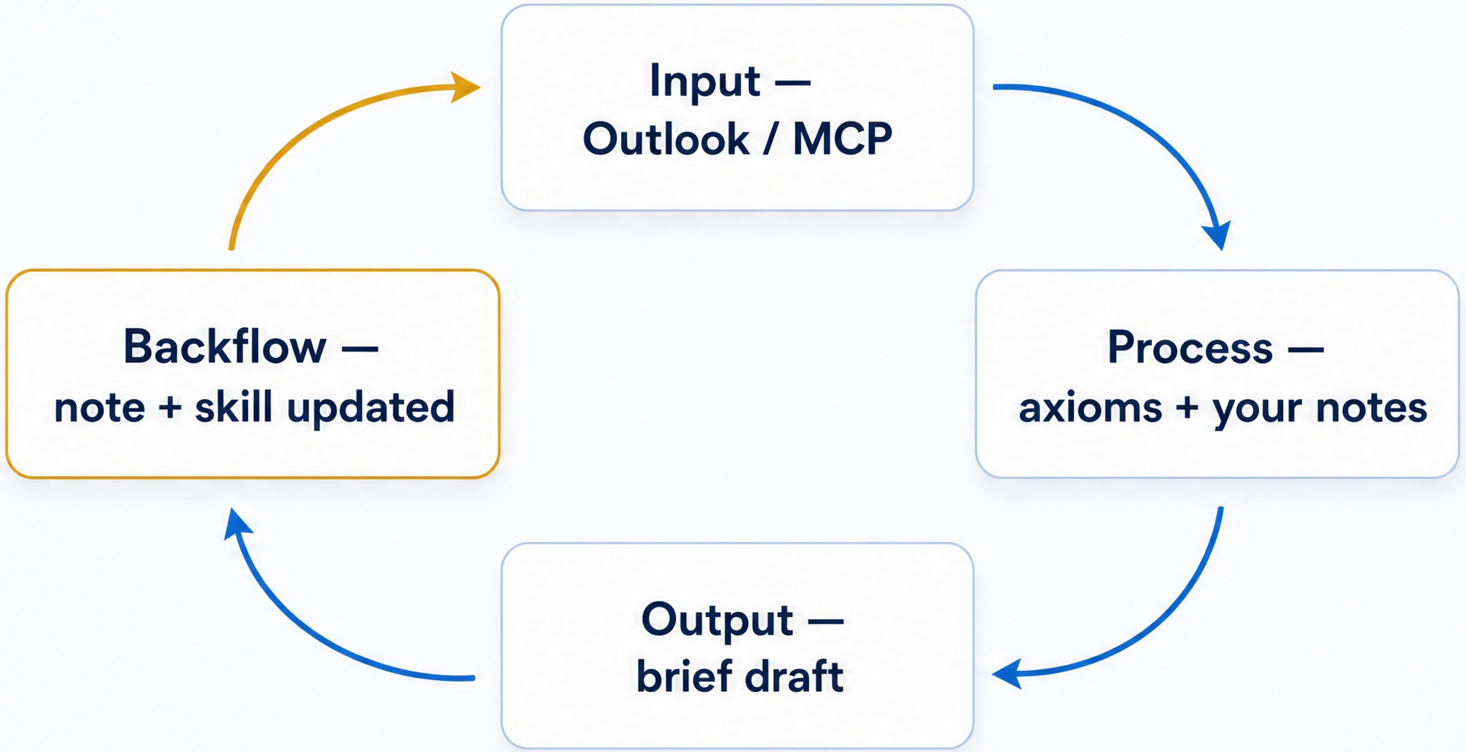

We write your words into the file

↓

Same prompt, run again — watch the brief change

Tier 2 becomes Tier 3 the moment you edit.

The loop closes

Next task starts where this one ended.

Three walls you will hit

1

The file dumpster

Piling material, storing no judgment

2

Output you can't trust

Made-up numbers, dead links

3

Babysitting at scale

18 tickers, hand-fed one by one

Session 3: each wall torn down — and you learn to write your own skills.

Take it home

EVERYONE

1. Clone the reference repo into myAI/
2. Fill in rules/USER.md — highest ROI move
3. Rerun the experiment yourself
4. Find one axiom you disagree with. Edit it. Rerun.
5. Rerun the MU brief on internal MCP data — prompts in the handout

AI FELLOWS (WITH TA, 1V3)

Reproduce the full loop
